## **One Stop Procedure Clinic Offers New Endovenous Laser Ablation to Eliminate Varicose Veins Without Surgery**

Minneapolis, MN – Venous disease is one of the most common medical conditions affecting millions of people. About half the U.S. population has venous diseases, with about 25% of all women and 15% of all men having significant varicose veins. Recent advancements in the treatment of varicose veins have been significant, treatment has never been better. The traditional treatment for varicose veins was surgical stripping and ligation, a surgical solution many patients found painful and long recovery time. One Stop Procedure Clinic is offering a far simpler, minimally invasive treatment called Endovenous Laser Ablation (EVLA).

"Using today's most advanced medical laser technology, EVLA makes varicose veins vanish without the disadvantages of older treatments," says Steven Shu, M.D. of One Stop Medical Center. "It's a fast, effective office procedure that involves minimal discomfort and site effects. After treatment, a patient can simply walk out of the office and resume normal activities immediately."

In the EVLA treatment, a laser fiber is inserted into the vein through a tiny puncture site. The laser energizes the fiber as it is withdrawn from the vein. Energy emitted from the tip of the fiber causes only the treated vein to close.

"This new laser treatment is perfect for today's busy lifestyle," adds Dr. Shu. "The patients can go back to work next days after the EVLA treatment. Now we can provide one stop vein care in combination with sclerotherapy, mini phlebectomy, and EVLA."

Dr. Shu specializes in office procedures, including hemorrhoid care, anal fissure and fistula surgeries, endoscopies (colonoscopy and gastroscopy), skin cancer care and other common skin surgery, cyst removal, breast biopsy, no-scalpel vasectomy, ingrown toenail removal, and lipoma removal. He performs nearly 3,000 procedures and surgeries every year.
